

SPIDERS (ARANEAE) THE HROCHOTSKÁ DOLINA VALLEY (POĽANA MTS, SLOVAKIA)

VALERIÁN FRANC

V. Franc: Pavúky (Araneae) Hrochotskej doliny (Poľana, Slovensko)

Abstrakt: Hrochotská dolina sa nachádza v centrálnej časti CHKO Biosférickej rezervácie Poľana. V skúmanom území sa vyskytuje široká škála klimaxových až polosekundárnych spoločenstiev: xerotermné dúbravy, bučiny až jedľové bučiny, sutóvé lesy s javorom horským a mezofílné až semixerofílné lúky. Prírodne najzachovalejšie sú zväčša strmé južné svahy doliny. Fauna pavúkov v oblasti Hrochotskej doliny v minulosti nebola skúmaná. V priebehu rokov 2004 až 2006 som tu s diplomantkou Martinou Mardiakovou realizoval prieskum araneofauny. Výsledky sú k dispozícii v tejto práci. Napriek značnej nadmorskej výške (Žiarec 1100 m) tu dominujú viac-menej teplomilné druhy pavúkov, ako i hmyzu. K významnejším a vzácnejším druhom pavúkov patria *Eresus moravicus*, *Dipoena braccata*, *Theridion nigrovariegatum*, *Walckenaeria simplex*, *Textrix denticulata*, *Callilepis schuszteri*, *Gnaphosa lucifuga*, *Phaeocedus braccatus*, *Poecilochroa variana*, *Thanatus sabulosus*, *Diaealivens*, *Tmarus stellio*, *Marpissa nivoyi* a *Pellenes tripunctatus*. Menej početnú skupinu druhov vyšších polôh zastupujú *Evania merens*, *Troxochrus nasutus*, *Tenuiphantes alacris*, *Acantholycosa lignaria*, *Pardosa sordidata* a *Xysticus slovacus*. Tieto údaje potvrdzujú mimoriadne prírodné hodnoty tejto lokality a podčiarkujú potrebu jej osobitnej územnej ochrany.

Kľúčové slová:

INTRODUCTION

Hrochotská valley with length approximately 16 km ranks among the most remarkable valleys in Slovakia from nature history point of view. The valley begins in the caldera of the former Poľana volcano, declining to the west. Southern slopes are prevailingly steep and rocky; and a large range of well-preserved habitats (including xerothermic oak forest, ancient beech forest, scree maple forest and mixed mountain beech-and-fir forest) occur there. The fauna of spiders has been recently studied in several sites of the Poľana Mts, including the central massif chiefly (SVATOŇ & MIHÁL, 2000), but, surprisingly, not in the Hrochotská valley. In order to improve this data insufficiency, I dealt with research of spiders in this area from 2004 to 2006 (occasionally before, too). I would like to thank Martina Mardiaková for co-operation in this research. The review of spiders (often scarcer and faunistically notable ones) of the Hrochotská valley is available in this paper.

MATERIAL AND METHODS

In this paper I summarise the results of my arachnological research in the Hrochotská valley (the grid-mapping square code 7382a), that was carried out from 2004 to 2006. I applied current methods of collecting, especially sweeping the vegetation, sifting the leaf litter, knocking down the spiders from tree branches and individual collecting under the bark and under stones. I have refused the trapping method due to its non-selectivity and harmfulness for the soil fauna. The material was identified according the keys by MILLER (1971), HEIMER & NENTWIG (1991), ROBERTS (1995) and LOKSA (1969, 1972).

The research was carried out in the following three sectors (distinguished by upper index in the legend of table 1): 1 Lower and the warmest part of the valley close to the Hrochoť

village, 2 Central part of the valley above the Bátovský volcanic boulder, 3 Upper part of the valley around the ‘Pri Bútłavke’ Nature Reserve. Dates of collecting and number of males (♂) and females (♀) are listed in table 1.

RESULTS AND DISCUSSION

‘Phytogeographic district’ and ‘Originality of habitat’ based on the criteria and evaluation by BUCHAR & RŮŽIČKA (2002); both will be calculated generally later. There were collected 232 spider species belonging to 28 families in the studied territory.

Table 1. Spiders at the Hrochotská dolina valley

Family / Species	Codes of records	Phyt. district	Originality of habitat	ESS
Pholcidae				
<i>Pholcus opilionoides</i> (Schrank, 1781)	A1/- C-/1s F-/1 J-/1	T (M)	CI SN D A

Codes of records: A – P dates of collecting, upper index (written only here) means 1 – lower and the warmest part of the valley close to the Hrochot' village, 2 – central part of the valley above the Bátovský volcanic boulder, 3 – upper part of the valley around the ‘Pri Bútľavke’ Nature Reserve. A² June 11, 2004, B² May 13, 2005, C¹ May 17, 2005, D¹⁻² May 23, 2005, E² June 1, 2005, F¹ June 3, 2005, G² June 14, 2005, H¹ June 19, 2005, I² June 21, 2005, J³ June 26, 2005, K² July 22, 2005, L² July 24, 2005, M² September 25, 2005, N¹ October 25, 2005, O² October 30, 2005, P¹ April 22, 2006. 1/2 one male and two females, -/1 one female, 1s/- one subadult male, + more individuals were registered and left. **Phytogeographic district:** T thermophilous, M mesophilous, O oreophilous species. **Originality of habitat:** Cl climax, SN semi-natural, D disturbed, A artificial. **ESS** ecosozological status in Slovakia (abbreviations → table 2); ¹ ought to be lower.

Remarkable records (marked by ‘◀’ in table 1) deserve special note:

1 *Eresus moravicus* – running on the ground of a rocky steppe, several males. A conspicuous species noticed at xerothermic grasslands.

2 *Ceratinella wideri* – sieved from the leaf litter in the shady ravine, 2 ♂, J. Svatoň redet. A little-known and apparently very rare species, nevertheless it may be misidentified with the relatives. Only two older published records are available: NR Jurský Šúr (7769b), June 1974, further data are inaccessible (JEDLIČKOVÁ, 1988) and Sklabiňa – Hradište (6979b) June 3, 1981, ♂ (SVATOŇ, 2005).

3 *Cinetata gradata* – in the leaf litter of ancient mixed forest, ♂. A very rare species of well-preserved mountain forest habitats. Only a few records from Slovakia are available: Strážovské vrchy Mts – Rohatín (6976c/7076a), swept from the forest vegetation May 26, 2003, ♀; Strážovské vrchy Mts – Strážov (7076b/d), in the leaf litter of scree beech forest June 10, 2004, ♂, V. Franc lgt. et coll.; Kremnické vrchy Mts – Lavrín (7380a), in the leaf litter of ancient beech-and-fir forest July 8, 1995, ♂, V. Franc & A. Hanzelová lgt. et coll.; Slovenský raj Mts (7187), dateless, the site is not mentioned (GAJDOS & SVATOŇ, 1993); Slovenský raj Mts – Klauzy (7188a), May, year is not specified, ♂ + ♀ (ŽITŇANSKÁ, 1987).

4 *Evansia merens* – in the colony of *Formica lemani* under the rotten log, ♂ + ♀. In the Poľana Mts it is also known from Javorinka (7482b) July 1998, 2 individuals, and Predná Poľana (7382d) July 1998, 6 individuals (SVATOŇ & MIHÁL, 2000). This scarce species is apparently myrmecophilous. It is cited from ant colonies of *Manica rubida*, *Formica fusca* and *Formica sanguinea* (MILLER, 1971), OBENBERGER (1949) states only *Formica fusca*. Actually, it highly prefers the host-ant *Formica lemani*, formerly considered to be a subspecies of *Formica fusca* only. But *Formica fusca* itself lives in warmer habitats of lower altitudes (often xerothermic), while *Formica lemani* occurs in mountain regions (BONDROIT, 1917). Only several further records from Slovakia are available: Veľká Fatra Mts – Kozia skala (7079b) July 12, 2001, ♀ (P. Gajdoš det.); Kremnické vrchy Mts – Skalka (7280c) May 17, 2002, 2 ♀; Muránska planina Mts – NR Veľká Stožka (7285b), under the stone near the edge of cliffs August 4, 2003, ♀, all findings V. Franc lgt. et coll.; Starohorské vrchy Mts – Panský diel (7280b), under the rotten log September 3, 2005, ♀, V. Franc & S. Korenko lgt. et coll.; Malá Fatra Mts – NR Rozsutec (7680d) (SVATOŇ & MILLER, 1979), Malá Fatra Mts – NR Suchý (6879b) (SVATOŇ, 1985), High Tatras Mts – NR Kriváň (6886a) (SVATOŇ, 1983). Old records from Oravská Magura Mts (580) and the surroundings of the Žilina city (6778) (KRATOCHVÍL & MILLER, 1937) are also available.

5 *Gongylidiellum vivum* – in the wet moss and leaf litter in the forest ravine, ♂. A very rare species of wet mountain habitats, known only from a few scattered records: MILLER (1974) mentions Vysoké Tatry Mts, in the wet moss of mountain forests; the further records are from Západné Tatry Mts – Jalovecká valley, 1992 (6884a/c), dateless – trapping method (GAJDOS, 1993); unpublished records are available from Kysucká vrchovina Mts, J. Svatoň

lgt. and from ‘Považské podolie’ river basin, Gajdoš lgt. (GAJDOŠ, SVATOŇ & SLOBODA, 1999). Recent record is known from Starohorské vrchy Mts – Panský diel Mt (7280b), in the wet leaf litter on a little forest marsh below the Šachtická saddle September 3, 2005, ♀ redet. J. Svatoň (KORENKO, 2006). The last records from Danubian alluvial forests (GAJDOŠ, 1995) and from the surroundings of the Trenčín city (GAJDOŠ, 2005) are especially notable: this species occurs in ‘soft’ (willow and poplar) alluvial forest here.

6 *Midia midas* – in a hollow oak occupied by the wood mouse (*Apodemus sylvaticus*) September 25, 1994, ♀ (P. Gajdoš redet.). The second finding is known from Urpín hill near the Banská Bystrica city (7280d), in the cavity of an old beech October 10, 1992, ♀; published as the first records for Slovakia (FRANC & HANZLOVÁ, 1996). A little-known species with hidden way of life, it is considered to be utmost rare relict species of ancient deciduous forests (RŮŽIČKA & BOHÁČ, 1991). The latest record is from the surroundings of the Šuľa village (7682a), under the bark of an ancient oak, 28. 4. 2010, ♂ V. Franc lgt. et coll.

7 *Tapinocyba pallens* – in the moss and leaf litter of open deciduous forest on the steep rocky slope, ♀ (J. Svatoň det.). A little-known tiny spider which may be misidentified with the relatives. It seems to be that it is nowhere abundant. Known from sporadic further records: nickel leach dumps near the Sered' town (7772a), 1993 – 1995, long-term trapping method (KRAJČA & KRUMPÁLOVÁ, 1998); the Bzaná NR (6900c), autumn 1999 – spring 2000 (trapping method), ♂; the Hlboké NR (6899c), autumn 1999 – spring 2000 (trapping method), ♂; a fen in the valley of the Stužica river (6901c), spring – autumn 2002 (trapping method), ♂ (SVATOŇ, THOMKA & GAJDOŠ, 2003); the Snina town – Pod Kamennou hill (7098b), November 10, 1999, 3 ♂ (THOMKA, 2003). Last record is known from the Starohorské vrchy Mts – NR Baranovo (7280b) May 1, 2005, ♂ (KORENKO, 2006). The difference between its habitats including climax (mostly protected) and artificial ones (nickel leach dumps) is highly contrasting.

8 *Troxochrus nasutus* – in the leaf litter of the shady deciduous forests, ♀. A little-known species of well-preserved mountain forests, considered to be a very rare spider. Only a few further records from Slovakia are available: Balocké vrchy Mts – ‘Tlstý javor’ hill (8373b) July 17, 1993, ♀; Bystrická vrchovina Mts – Urpín (7280d), swept from the vegetation in a forest clearing May 26, 1995, ♀; Hrochoť – NR Jelšovec (7381b), in the wet moss of a bog edge June 4, 1995, ♀; all findings V. Franc & A. Hanzelová lgt. et coll.; Veľká Fatra Mts – Zvolen (7181a), in the debris of an open beech forest June 27, 2001, 1 ♀ (FRANC, 2002). Later it was found in Vtáčnik Mts – Brložnô (7377c) 1991 undated – pitfall trap (GAJDOŠ, 1997).

9 *Titanoeca quadriguttata* – in a little forest-steppe refugium on the rock edge surrounded by mixed ancient forest approx. 900 m a. s. l., June 21, 2005, ♂. This finding of thermophilous species in the core area of mountain forests is highly noticeable.

10 *Micaria fulgens* – on the scree in the forest clearing surrounded by mixed ancient forest approx. 950 m a. s. l., ♀. A scarce species of rocky steppes and edges. Its occurrence in the continual ancient forest area is very remarkable; BUCHAR & RŮŽIČKA (2002) state that its height amplitude is 200 – 500 m a. s. l.

11 *Poecilochroa variana* – among detritus and gravel on the rocky steppe, juvenile ♀ (J. Svatoň redet.). A very rare species, known from only a few records: NR Devínska Kobyla (7867b), June 4, 1978, ♂ (P. Gajdoš lgt.), the first record for the territory of Slovakia (GAJDOŠ, SVATOŇ & KRUMPÁL, 1984); Slovenský kras Mts – Brzohôrka (7388d) and Gombasek (7488b), dateless (SVATOŇ & MAJKUS, 1988); NR Soví hrad (7785d), April 22, 1995, juvenile ♂ and the surroundings of the Gemerské Dechtáre village (7786a/c), April 29, 1995, juvenile ♂ (FRANC & HANZLOVÁ, 1995); Lackovce village: Veliká (7097d), summer – autumn 2001 (trapping method), 2 ♂ + ♀; Dlhé nad Cirochou village – a foot of the Biely vrch hill (7098a), autumn

1998 – summer 2000 (trapping method), 3 juvenile ♀ (THOMKA, 2003); Banská Bystrica – Jakub (7280b/d), running on the ground of a xerothermic karst slope June 21, 2005, ♂, V. Franc & L. Durbáková leg.

12 *Philodromus longipalpis* – knocked down from the branches of a hazel (*Corylus avellana*), ♂ + ♀ (J. Svatoň redet.); the second, or, actually, the first properly documented record for the territory of Slovakia! A very little-known and apparently rare species, known only from single record from the NR Báb (7673c), cited as “*Philodromus aureolus* ssp. *pallens*” 1968 – 1969, trapping method, 4 individuals, additional detailed data are inaccessible (ŽITŇANSKÁ, 1973).

13 *Thanatus sabulosus* – swopped from the vegetation of a forest steppe, ♂ + ♀. A rare species of warm habitats, both well-preserved and apparently disturbed as well. The first record for Slovakia was published from the NR ‘Veľká skala’ (7377b) July 8, 1988, ♂ (GAJDOS, 1991). The further records: Zemplínske vrchy Mts (7596), undated and unpublished (GAJDOS, SVATOŇ & SLOBODA, 1999); NR ‘Ostrov Kopáč’ (7968b) originally cited as “*Thanatus* sp.” (GAJDOS, 1987); Ostrôžky Mts – Nedelište (7682a/b) June 28, 2000, 2 ♂, Gajdoš det. (FRANC, 2001); Bystrická vrchovina Mts – Stará Kopa hill (7281c) June 14, 2002, ♂ (FRANC, 2006); and Sered' (7772a), nickel leach dump (KRAJČA, 1996). The last record cited from disturbed anthropogenic environment is surprising and highly notable.

14 *Diaealivens* – knocked down from the branches of a solitary oak, ♂ (J. Svatoň redet.); the third record for the Slovakian fauna! A very local-and-rare species of open deciduous forests, often pasture woodlands. The first record from Slovakia was published from Protected site Gavurky near the Dobrá Niva village (7580b), on the branches of an old solitary oak May 22, 1992, ♂ (FRANC & HANZELOVÁ, 1996). Thomka found one male of this species in Jasenov – Hôrka (7097c) on June 15, 1994 and published it as the first record for Slovakia as well (THOMKA, 1996), because he did not have information about referred finding in Protected site Gavurky.

15 *Xysticus slovacus* – swept from the vegetation of forest edge, ♀ (J. Svatoň det.). A little-known recently described species of higher altitudes which probably seems to be infrequent. Only a few records from Slovakia including the type material are available: NR Švihrová (6884d), peat bog, July 4 – 6, 1995, 4 ♂ + 26 ♀, E. Svatoňová et R. Prídavka leg.; Volovské vrchy Mts – Pálenica (7189c) July 30, 1996, 2 ♀, J. Svatoň leg.; Slovenský raj Mts – Lesnica (7088d) August 7, 1976, ♀, O. Žitňanská leg.; Poľana Mts – Vrchslatina (7383d) July 10, 1998, 12 ♀, E. Svatoňová leg.; Belanské Tatry Mts – Javorina (6786b) July 10, 1958, ♀, J. Žďárek leg.; all records RŮŽIČKA, KŮRKA, BUCHAR & ŘEZÁČ (2005).

The scarcer spider species are often mentioned in the accessible Red Lists of several European countries; it concerns the Red List of Slovakia (GAJDOS & SVATOŇ, 2001), Czech republic (BUCHAR & RŮŽIČKA, 2002), Germany (PLATEN, BLICK, SACHER & MALDEN, 1998), Austria – Carinthia County (KOMPOSCH & STEINBERGER, 1999), Poland (STAREGA, 2004), Slovenia (POLENEC, 1992), Great Britain (MERRETT, 1991), Sweden [GÄRDENFORS (ed.), 2000], Finland (RASSI et al., 2001), Norway (ÅKRA, HAUGE & POMMERESCHE, 2006) and the Belgium (MAELFAIT et al., 1998). Ecosozological status (ESS) of prevailingly scarcer species, cited at least in three of the Red Lists mentioned above, is accessible in the table 2.

CONCLUSIONS

In this paper 224 spider species from the studied territory are mentioned. Despite this mountain area, prevailingly covered by forest, reaches over 1 000 m a. s. l., more-or-less clearly thermophilous species share nearly 40%, while the share of oreophilous, montane species is lesser than 10% (Fig. 1). Mesophilous species of temperate environments are slightly prevailing (55.38%). Scarcer or even very rare species of xerothermic grasslands and forest steppes include *Eresus cf cinnaberinus*, *Dipoena braccata*, *Theridion nigrovargiegatum*, *Walckenaeria simplex*, *Textrix denticulata*, *Callilepis schuszteri*, *Gnaphosa lucifuga*, *Phaeocedus braccatus*, *Poecilochroa variana*, *Thanatus sabulosus*, *Tmarus stellio*, *Marpissa nivoyi* and *Pellenes tripunctatus*. The species of temperate or colder (sub)mountain forests include *Evansia merens*, *Troxochrus nasutus*, *Tenuiphantes alacris*, *Acantholycosa lignaria*, *Pardosa sordidata* and *Xysticus slovacus*. The finding of *Philodromus longipalpis* is the second record for the territory of Slovakia, while *Ceratinella wideri* and *Diaealivenes* are the third records for Slovakia. *Midia midas* has been published as the first record for Slovakia.

The measure of habitat disturbance by anthropogenic activities is prevailingly low. The species of well-preserved or merely little-disturbed (semi-natural) habitats are highly prevailing in the studied area (Fig. 2), together it is more than 93%. It indicates the relatively

sp[e] calculated species equivalent

highly satisfactory state of the habitat conservancy in this territory and in the Poľana Mts generally. The list of spider species mentioned above is not definitive, of course. I would be glad to continue the spider research in this considerable area ranking among one of the richest arthropod sites in the whole Slovakia. Moreover, a big amount of rare insects (e. g. beetles and butterflies) were also documented here. On the other hand, effective nature conservation

of this territory will not be easy and lacking conflicts, because it will be necessary to control the following activities seriously:

- wood exploitation, especially clear-felling procedures in less-extreme slopes;
- building of further timber roads and rope-ways;
- deforestation by allochthonous and unsuitable vegetation (spruce monocultures);
- movement of illegal hunters and poachers;
- expansion of cottages, tourist objects, paths and ski-tracks, etc.

Finally, it ought to be necessary to deal seriously with the nature protection management of the whole area of the Hrochotská valley, because this highly noticeable territory, with exception of a little Nature Reserve ‘Pri Búťlavke’ is actually out of the territorial protection. The State Nature Conservancy of the Slovak republic aims to establish a larger nature reserve here. But, actually, it will obviously be very difficult, because the position of conservationists and nature-scientists is temporarily unfavourable in this country.

Acknowledgement

Some specialists including P. Gajdoš and J. Svatoň help to the author determine difficult spider species.
